

Test	When	Purpose
Routine Physical Exam	First Prenatal Visit	Screening test to determine the status of pregnancy any risk factors, and help make plans for prenatal care. Blood tests done are blood type, blood count and state required tests to screen for infection: hepatitis, rubella, syphilis, Chlamydia and gonorrhea. Optional tests-HIV and cystic fibrosis screening.
Quad Screen	15-20 weeks	Optional screening test that may detect increased risk for open neural tube defects and Trisomy 18, 21.
Gestational Diabetes Screen	24-28 weeks	Screening test for asymptomatic diabetes and anemia pregnancy.
Antibody screen & Rhogam injection RH negative patients only	28 weeks	To screen and prevent RH sensitization.
Group B Strep Culture	35-37 weeks	To screen for Group B strep, carried in the vaginal/rectal area, so that preventative antibiotic therapy can be administered in laborz.

ULTRASOUND TESTING

Routine screening ultrasounds will be performed at 19-21 weeks. This allows us to confirm your due date, look at the baby's major organs and also determine the sex of the baby if desired. Additional ultrasounds and other testing may be recommended as individually indicated.

OPTIONAL TESTING

Cellfree DNA Testing
Sequential Screen Information
